

Frame It as Cases: Work That Speaks for Itself (Week 2)

Name: Bhoompally Kalyan Reddy

1. Voice Card

This is the standing instruction I gave to the AI for how I want my writing to sound:

"Direct, professional, data-driven, concise, no buzzwords."

2. Framed Case Study: Predicting Content Decay

The Problem: FlyRank processes over 79 million rows of website performance data. The content editorial team didn't know which articles were naturally decaying versus pages that were just having a temporary bad week. Because they couldn't tell the difference, they were wasting hours updating the wrong pages while the real problem pages bled traffic.

What I Did (and Decided): I built a Machine Learning model (Random Forest Classifier) to predict whether a web page would suffer a severe 20%+ traffic drop in the next 30 days. To do this, I queried massive parquet files using DuckDB and engineered historical momentum features.

The most important decision I made was regarding validation: I used a GroupShuffleSplit on the client ID. This ensured the model was tested on completely unseen websites, preventing data leakage and proving the model actually learned universal patterns, not just memorized specific clients.

The Outcome: The model achieved 74% accuracy, successfully outperforming the human-rule baseline by 6%. Rather than claiming it was a magic crystal ball, I framed it as a directional decision-support tool. It successfully generates an automated, ranked queue of the Top 50 "At-Risk" pages, allowing the human editorial team to prioritize their workflow efficiently.

3. Bio & Call to Action (CTA)

Bio: I am a Machine Learning Intern focused on predictive modeling, data engineering, and building honest AI systems that solve real business problems.

CTA: Let's connect! I am currently looking for roles in Data Science and Machine Learning. Reach out on LinkedIn!

4. AI Editing: Before & After

Here is an example of a generic sentence the AI tried to write, and how I heavily edited it to match my Voice Card:

Generic AI Draft: "I seamlessly orchestrated a paradigm-shifting machine learning pipeline that synergized big data to proactively mitigate website traffic attrition."

My Edited Version: "I built a Random Forest model using DuckDB to predict website traffic drops before they happen."
